Manufacturing companies have extensive volumes of business-critical data to protect. In order to ensure business continuity and viability after a significant data loss event, manufacturing companies must implement a reliable data backup system that has the capacity to store unlimited amounts of digital data for long periods of time. Storage Protection Services (SPS) offer a secure and cost-effective online backup solution that is designed to meet the data storage needs of a manufacturing company.

The SPS online backup solution not only guarantees the integrity, confidentiality and full recovery of all retained backups, but also facilitates the remote management of a complex data storage system. With the SPS system, all data is encrypted at the source and maintained in this secure state throughout the entire backup process. After full data encryption has been achieved, the encrypted files are transferred over an Internet connection and password-protected backups are stored at our remote data storage facilities. If data loss occurs due to an unforeseen emergency, the SPS system features on-demand restoration capabilities for seamless business continuity.

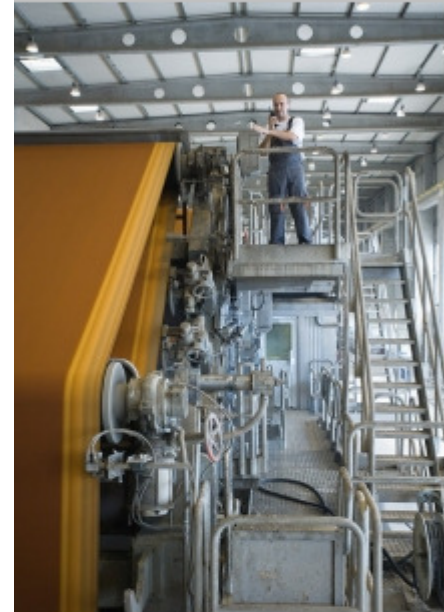

Manufacturers have a wide range of business-critical data that must be protected against loss or corruption. SPS Remote Backup is a simple and cost-effective backup solution designed to accommodate the extensive data storage needs of manufacturers. Providing full data encryption throughout the entire backup and restore process, automatic and scheduled data backup over a secure internet connection, the SPS system ensures the integrity and availability of all business data and eases the management of a large and complex environment.

The SPS Remote Backup service offers manufacturers peace of mind knowing that not only is business data offsite at a secure location, but that it is also immediately available for fast restores when required. Offsite backups, coupled with the option for local backups allowing for even faster restores, give manufacturers the assurance that business is protected according to the demanding needs of their environment.

Storage Protection Service Remote Backup was designed to be simple and automatic, easing the burden of backup management. With encryption and the reliable nature of disk-to-disk backups, critical data is secure and available to you. Unless authorized, no one, not even SPS technicians, can access a company's backup data since it is protected using an encryption key unique to each client.

## Key Benefits:

- No large upfront costs
- Compliant with all IT-related state and federal legislation (such as Sox, GLB...)
- Integrated audit trail
- Automatic offsite backup for total data security
- Data remains encrypted throughout the entire process
- Options that provide a secure offsite backup and local backup for fast restores
- Immediate access to restore any retained backup of file
- Ability to backup laptops and desktops as required
- Immediate access to retained backups for full or partial restores
- Guaranteed privacy, security and availability of all backup data
- Agentless architecture allows growth as needed without expensive licensing
- Continuous Data Protection for Windows servers
- Bare Metal Restore support for Windows
- No licensing for additional options or features

## Typical Clients Include:

Building Equipment  
Manufacturers

Chemical Equipment  
Manufacturers

Clothing Manufacturers

Construction Equipment  
Manufacturers

Furniture Manufacturers

Medical Equipment  
Manufacturers

Optical Equipment Manufacturers
